

ADF38: Opacity project extension: photoexcitation-autoionisation rate coefficients

The basic process is $1s^2nl + \gamma \rightarrow 1sln'l' \rightarrow 1sn''l'' + e$. A separate file is provided for each n , which contains data for all $n' \geq n$. Note however that $1sln'l' \leftrightarrow 1s^2n'l' + \gamma$ has to be considered consistently at the same time to avoid multiple counting. It is convenient at the production stage to separate the level list file (denoted by the postfix 'l') from the rate file (denoted by postfix 'r'). Separate files are given for term (LS) coupling and intermediate (IC) coupling. Conventions used are (1) L=-1=> the outer electron is part of the core - ; (2) '*' after L (>=0 only) means that the nl electron was active – otherwise it is assumed passive.
