## ADF39: Opacity project extension: photoionisation cross-sections

The basic process is inner shell photo-ionisation  $(n_c l_c^q)nl + \gamma \rightarrow (n_c l_c^{q-1})nl + e^-$ . A separate file is provided for each  $n$ . It is convenient at the production stage to separate the level list file (denoted by the postfix 'l') from the partial cross-section file (denoted by postfix 'px'). Separate files are given for term (LS) coupling and intermediate (IC) coupling. Outer shell photo-ionisation,  $(n_c l_c^q)nl + \gamma \rightarrow (n_c l_c^q) + e^-$ , is included for completeness. Where inner shell photo-ionisation is present, the atomic structure is optimised for the inner-shell processes.

*Utilising subroutines :*

ADAS204?      ADAS208?      ADAS212?

*Formatted files to ADF39 specification :*

<i>name</i>	<i>meaning</i>
SEQ	sequence identifier (two characters)
IZ0	nuclear charge
CCPLG	coupling scheme, ‘/LS/’ => LS coupling
BWNP	binding wave number of lowest parent (cm-1)
NPRNT	number of metastable parents (including ground parent)
INDP	index of parent
IND0	parent idndex as used in the ‘px’ file
CFGP	configuration (or Eissner code therefor) for parent.
ISP	multiplicity of parent ( $2S_p+1$ )
ILP	lotal orbital quantum number ( $L_p$ ) for parent
XJP	(statist. weight - 1)/2 of parent term
WNPI	energy of parent term relative to lowest parent (cm-1)
BWNR	binding wave number of lowest resolved term (cm-1)
NTRM	number of terms in LS-resolved set
INDX	index value for term

IRSL	initial term index as used in the 'px' file
CFGT	configuration (or Eissner code therefor) for level.
IS	multiplicity for level (2*S+1)
IL	total orbital quantum number for term
XJ	(statist. weight - 1)/2 for term
WNRI	energy of term relative to ground (cm-1)
